Comparison Legend Notes

The Comparison Legend lists the data fields present in the existing TWIA Commercial Applications and presents a side-by-side comparison of the data fields present in the revised TWIA Commercial Applications.

Fields

Column A: Item

The first column lists the data field items in sequential order. As a result of the transition from the current electronic application to a printable application, there are four different categories of items corresponding to the various changes made to the data fields included in the applications. Each category is represented by a different color.

- Item numbers with green borders are present in both the existing Applications and new Applications.

  1

- Item numbers with blue borders are present only in the new Applications.

  2

- Item numbers with yellow borders are present in the existing Applications, but, while included as a component of the new electronic application process occurring in the background, are not included in the new final printable application output.

  3

- Item numbers with red borders are present in the existing Applications, but not the new Applications. These data fields were removed from the new application for the following reasons:
  - to reflect updated business processes;
  - they are entered into and/or stored in TWIA's systems outside of the new application process.

  4

Column B: Location in Existing Policy Center Application

This column indicates where in the existing Policy Center Application the applicable text is located by referencing the screen or series of screens and tabs containing the text.

Column C: Existing Application Text

The actual text present in the existing Application.

Column D: New Application Equivalent

The actual text present in the new printable Application.

<u>Notes</u>

Bracketed Text

If text is contained in [brackets] this indicates either the information varies, or the text within the bracket is a note regarding the actual text in the Application.

Sample Information

All information contained in the screen captures was generated for sample Applications and does not relate to any actual policy or application information.
